## PRINCIPALES ESPECES DEBARQUEES AU SENEGAL

### 1. - Espèces pélagiques

| <u>Nom commun</u>          | <u>Nom scientifique</u>                   |
|----------------------------|-------------------------------------------|
| Albacore                   | Thunnus albacares                         |
| Anchois                    | Anchoa guineensis                         |
| Bogue                      | Boops boops                               |
| Bonite à dos rayé          | Sarda sarda                               |
| Brochet                    | Sphyraena spp.                            |
| Carangue, grande carangue  | Caranx spp.                               |
| Carpe blanche, sompatt     | Pomadasys spp.                            |
| Ceinture, poisson sabre    | Trichiurus lepturus                       |
| Chinchard jaune            | Decapterus rhonchus                       |
| Chinchard noir, saurel     | Trachurus spp.                            |
| Coryphène commune          | Coryphaena hippurus                       |
| Disque, drépane            | Drepane africana                          |
| Ethmalose                  | Ethmalosa fimbriata                       |
| Liche                      | Lichia spp.                               |
| Lista0                     | Katsuwonus pelamis                        |
| Maquereau                  | Scomber japonicus                         |
| Maquereau-bonite           | Orcynopsis unicolor, Scomberomorus tritor |
| Mulet                      | Mugil spp., Liza spp.                     |
| Mussolini, vomer           | Selene dorsalis                           |
| Patudo                     | Thunnus obesus                            |
| Pelon                      | Brachydeuterus auritus                    |
| Petite carangue, plat-plat | Chloroscombrus chrysurus                  |
| Sardinelle plate           | Sardinella maderensis                     |
| Sardinelle ronde           | Sardinella aurita                         |
| Scyris d'Alexandrie        | Scyris alexandrina                        |
| Tassergal                  | Pomatomus saltator                        |
| Tétronon                   | Lagocephalus sp., Ehippion sp.            |
| Thonine                    | Euthynnus alletteratus                    |
| Trachinote                 | Trachinotus spp.                          |
| Voilier                    | Istiophorus platypterus                   |

### 2.- Espèces de fond

## L A P E C H E C H A L U T I E R E

Les ressources démersales du plateau et du talus continental sénégalais < crustacés, poissons et céphalopodes > sont exploitées par 2 types de flottilles chalutières :

- une flottille basée à Dakar, en majorité sénégalaise,
- une flottille étrangère opérant généralement dans le cadre d'accords de pêche (italiens, grecs, espagnols et gambiens).

### 1. LA FLOTTILLE BASEE A DAKAR

Deux types de pêche sont pratiqués :

- la pêche chalutière côtière de fond,
- la pêche chalutière profonde.

#### 1.1. LA PECHE CHALUTIERE COTIERE DE FOND

axé principalement sur les espèces démersales côtières (crevette bleue, soles, rouget, seiche, dorades...), ce type de pêche est pratiqué, en 1986, par 149 chalutiers sénégalais.

Le volume des prises débarquées est passé de 53 752 tonnes à 60 222 tonnes, soit une augmentation de 12% environ.

il faut noter que les prises débarquées à Dakar proviennent non seulement du plateau continental sénégalais, mais également de Mauritanie, Gambie, Guinée Bissau et Sierra Leone.

Cette augmentation des débarquements est essentiellement due à l'exploitation du poulpe dont les prises ont atteint 7 708 tonnes (contre 450 tonnes seulement, en 1985).

Les modifications dans la composition de la flottille, amorcées en 1985, se sont poursuivies avec la transformation de glaciers en congélateurs et l'entrée dans la pêcherie de congélateurs de fort tonnage (plus de 250 tjb). Les congélateurs représentent, ainsi, 46% de la flottille actuelle.

L'effort de pêche des glaciers, en termes de nombre de marées et jours de mer, a sensiblement baissé : - 21% et - 19%, respectivement. Chez les congélateurs, cet effort a augmenté de 8X et 22%.

Les rendements globaux, pour les différentes classes de chalutiers, ont légèrement diminué, à l'exception des glaciers de plus de 250 tjb et des congélateurs de plus de 150 tjb.

#### 1.2. LA PECHE CHALUTIERE PROFONDE

9 chalutiers sénégalais de 251 à 500 tjb (les mêmes qu'en 1985) ont exploité, en 1986, les stocks profonds de crevettes et de crabes rouges. Grâce aux informations fournies par la S.I.S.P.A., les statistiques ont été complétées pour cet armement.

La flottille a effectué 49 marées, en 1986, soit 17% de moins qu'en 1985. Le volume de leurs captures s'élève à 1 821 tonnes, soit 7% de moins qu'en 1985. Le rendement moyen par jour de mer est de l'ordre de 700 kg/jour, pour une estimation de 2 600 jours de mer, pour l'ensemble de la flottille.

## 2. LA FLOTTILLE NON BASEE A DAKAR

Deux types de pêche sont pratiqués par cette flottille constituée de chalutiers étrangers :

- la pêche chalutière côtière,
- la pêche chalutière profonde.

### 2.1. LA PECHE CHALUTIERE COTIERE

Elle est pratiquée par des navires pêchant sous licence, dans le cadre d'accords. Il s'agit des chalutiers italiens (7), grecs (13) et gambiens (7). Leurs statistiques, non contrôlées par le CRODT, proviennent des bordereaux de captures remplis par les observateurs et marins-observateurs du projet "Protection et Surveillance des Pêches au Sénégal". Ces navires sont crevettiers, poissonniers, seichiers ou poulpiers.

Dans le présent document, seuls les résultats globaux sont indiqués. Les statistiques détaillées feront l'objet d'un rapport plus complet.

### 2.2. LA PECHE CHALUTIERE PROFONDE

30 navires de nationalité espagnole (contre 31 en 1985) dont 22 crevettiers et 8 chalutiers de pêche fraîche ont exploité les stocks profonds en 1986. Leurs statistiques, non contrôlées par le CRODT, proviennent des bordereaux de captures remplis par les observateurs du projet "P.S.P.S." et des formulaires de déclaration (partielle) de captures remplis par les armateurs. La totalité des marées n'étant pas couverte par les observateurs, les résultats globaux indiqués seront donc considérés comme provisoires. Les statistiques détaillées feront l'objet d'un rapport, après validation et analyse.

TABLEAU 3.- Composition de la flottille chalutière basée à Dakar  
au 31 décembre 1986

| TYPES DE PECHE    | -51 | 51-150 | 151-250 | 251-500 | + 500 | TOTAL |

## 1. ACTIVITE GLOBALE DE LA PECHERIE EN 1986

Le déclin de l'activité des sardiniers dakarois se poursuit. Il est à remarquer qu'aucun sardinier de plus de 100 tjb n'a travaillé en 1986. 5 bateaux seulement ont fréquenté la pêcherie (21 en 1982), pour une prise totale de 3 150 tonnes, soit le dixième des captures effectuées en 1982. Cette prise totale est la plus basse enregistrée depuis le début de la collecte des statistiques de pêche, en 1965.

Un seul bateau a effectué plus de 170 marées dans l'année (ce même bateau en avait effectué 232 en 1982, année dont le record était de 304 marées). Le nombre annuel moyen de marées par bateau est de 136 (170, en 1982, pour les bateaux de cette catégorie). Le nombre moyen de bateaux en activité, par mois, est de 4,2, soit 30% de 1985 qu'en 1995, année où cet indice avait déjà chute de 23% par rapport à 1984.

L'effort de pêche global déployé par la pêcherie n'atteint que 516 jours de mer. La P.U.E. est inférieure à 10 T/Jour de mer, soit une prise moyenne de 4,6 tonnes par marée.

## 2. EVOLUTION DES PRISES

Les espèces dont la quantité débarquée a progressé par rapport à 1985 sont : le maquereau, le chinchard jaune et les poissons divers. Les débarquements de toutes les autres espèces ont régressé. Les sardinelles rondes représentent, avec 1 420 tonnes, moins de 50% des prises, tandis que les sardinelles plates contribuent, avec 1 260 tonnes à 40% de la capture totale.

## 3. EVOLUTION DES SECTEURS DE PECHE (Voir la carte)

La concentration de l'activité de la flottille à proximité immédiate de la côte et du port de Dakar se poursuit. 81% des visites ont été effectuées dans la zone statistique "DAKAR" en 1986, contre 72% en 1985. Les zones "DAKAR" et "SARENE" ont regroupé 99% des marées. Aucun bateau n'a pêché en Casamance ni dans les zones situées au nord de Dakar.

L'activité des bateaux est très côtière : plus de 63% des visites ont été effectuées dans le secteur statistique "15 m" dont la bordure la plus profonde, au sud de Dakar, est située, en moyenne, à 15 milles de la cote. Le secteur "100 m" n'a été prospecté qu'en zone "DAKAR" où sa limite extrême est éloignée de moins de 15 milles de la cote.

## 4. CONCLUSION

La vétusté des bateaux, la faible motivation des équipages, la gestion inadaptée de la flottille par certains armements et la difficulté d'accès au crédit sont, avec les pt-oblèmes de marché, les causes principales de l'effondrement actuel de la pêcherie sardinière dakaroise.

Les résultats de la pêche piroguère et les prospections scientifiques sur les cotes sénégalaises montrent que l'état des ressources en petits pélagiques côtiers n'est pas, actuellement, à mettre en cause.

# LA PECHE THONIERE

par

M. DAYRE

T. DIOUF

A. FONTENEAU

G. GENE

J. DIATTA

## L A P E C H E T H O N X E R E

La pêche thonière s'intéresse traditionnellement à 3 espèces (albacore, listao, patudo) qui sont exploitées, d'une part, par une flottille basée à Dakar constituée de 19 canneurs français et sénégalais et de 4 senneurs sénégalais en activité (dont un débarque essentiellement ses captures à Abidjan), et d'autre part, par une flottille étrangère de senneurs français, ivoiriens, marocains, espagnols, cubain et ghanéens dont une partie seulement des captures est débarquée à Dakar.

D'autres espèces, comme les petits thonidés (3 espèces) et l'espadon-voilier, intéressent également la pêche thonière, mais les niveaux d'exploitation restent encore médiocres par manque de débouché.

### 1. LA FLOTTILLE THONIERE BASEE A DAKAR

La flottille thonnière basée à Dakar se compose, en 1986, de 17 canneurs français, 2 canneurs et 4 senneurs sénégalais.

Le montant global des captures réalisées par ces bateaux, en 1986 (11 876 T) est en diminution par rapport à celui de 1985 (-3 071 T) soit 20%. Cette baisse s'explique par une diminution de l'effort de pêche observée tant chez les canneurs (-28%) que chez les senneurs (-9%) et par un démarrage tardif des campagnes de pêche. Cette flottille débarque la totalité de ses captures à Dakar. Mais, en 1986, un senneur sénégalais a effectué des débarquements à Abidjan (609 T) soit 28% de ses captures.

### 2. LES FLOTTILLES ETRANGERES

Les débarquements et transbordements de la flottille thonnière franco-ivoiro-marocaine à Dakar en 1986 (6 267 T) sont en augmentation (+ 17,8%). Cette augmentation est due, en partie, aux bonnes pêches réalisées par les quelques senneurs revenus dans l'Atlantique après leur séjour dans l'Océan Indien. Les débarquements et transbordements des flottilles thonnières étrangères (Espagne + Ghana + Cuba) en 1986 (21 214 T) ont également augmenté par rapport à 1985 (+ 7,3%), des suites, surtout, de bonnes prises de listao.

L'activité d'ensemble (tous débarquements et transbordements confondus, à l'exception des cargos frigorifiques) du port de Dakar, en 1986, (39 360 T) est en légère diminution (- 2,3%) par rapport à celle de 1985.

L'activité de l'ensemble de la flottille strictement sénégalaise, tous ports de débarquement confondus, s'élève, cette année, à 3 700 T, soit près de la moitié de celle de 1985.

### 3. LES AUTRES PECHERIES

Plusieurs espèces de thonidés de petite taille (thonine, auxide, maquereau-bonite, bonite à dos rayé) font l'objet de plusieurs pêcheries et méritent, de ce fait, une mention particulière.

De même, l'espadon-voilier, grand pélagique capturé en même temps que certaines espèces de thons. Fait l'objet de plusieurs pêcheries mais surtout artisanale et sportive.

#### 3.1. CAPTURES DE PETITS THONIDES

Les prises de petits thonidés, en 1986, (8 024 T) ont augmenté de près de 37% par rapport à 1985. Cette augmentation est due, en partie, aux bonnes prises de thonine t-balisées par les pêcheries artisanales. Les prises de bonite à dos rayé et de maquereau-bonite sont voisines de celles de 1985. Les captures réalisées par les unités industrielles concernent la thonine et l'auxide, espèces qui sont mal distinguées dans les livres de bord. Mais elles ne sont pas toutes déclarées. Aussi les variations observées d'une année à l'autre sont sans signification réelle.

#### 3.2. CAPTURES DE VOILIERS

Les captures globales de voiliers, en 1986, (612,5 T) ont augmenté de 119% par rapport à celles de 1985. Cette augmentation est surtout le fait des pêcheries artisanales où un effort de plus en plus important est dirigé sur cette espèce, suite à l'existence de débouché commercial local. Les captures de la pêche sportive, en 1986, (43,1 T) sont légèrement supérieures à celles de 1985 (34,8 t).

#### 3.3. CAPTURES D'ESPADON

Aucune pêche notable d'espadon, n'est à signaler en 1986, en raison de la cessation quasi totale d'activité de la pêche palangrière espagnole.

## LA PÊCHE ARTISANALE

### 1. LE PARC PIROGUIER

Il n'y a pas eu de recensement du parc piroguier en 1986, les résultats de 1982 à 1985 n'ayant pas montré de variations importantes de 5 unités, au niveau de la façade maritime : 4 382 pirogues opérationnelles en avril 1982, 4 415 en mai 1983, 4 465 en avril 1984 et 4 379 en avril 1985.

Aussi, les données obtenues en 1985 ont été considérées pour 1986, soit 160 points de débarquement, 4 379 pirogues de mer en avril et 4 249 en septembre, 2 395 pirogues de fleuve en avril et 3 451 en septembre. Le parc opérationnel a été donc estimé à 6 774 unités en avril et 6 700 en septembre avec des taux d'activité respectifs de 03% en saison froide et 78% en saison chaude.

### LA PRODUCTION

En 1986, les mises à terre ont été estimées à 201 137 tonnes. Elles ont ainsi accusé un accroissement de 32 868 tonnes (19,5%) par rapport à 1985. Cette augmentation a été plus nette chez les pélagiques (28 919 tonnes) que chez les démersaux (2 897 tonnes).

Les espèces concernées sont la sardinelle ronde, le maquereau et le poulpe qui ont donné lieu à des prises supplémentaires respectives de 20 621 tonnes, 3 815 tonnes et de près de 3 000 tonnes, du fait de leur forte disponibilité qui a entraîné une plus grande activité des pêcheries à la senne tournante et à la ligne.

C'est surtout dans les régions de Thiès et du Cap Vert qu'ont été enregistrées les plus fortes hausses, soit respectivement 23 277 tonnes et 9 631 tonnes.

---

N.E. Les légères différences que l'on notera à certains tableaux sont dues à l'arrondi des décimales par l'ordinateur.
