FEVRIER 1976.

INTRODUCTION

Ce document présente les données brutes mensuelles et annuelles de la pêche effectuée par les sardiniers basés à Dakar sur les poissons pélagiques côtiers du Sénégal en 1974.

Ces résultats seront interprétés avec ceux de l'année 1975 dans une autre publication.

PRESENTATION DES DONNEES

Ce recueil est constitué d'une série de tableaux mensuels, donnant l'état de la pêche dans un secteur donné. Ceux -ci sont repris et cumules en fin de publication pour représenter la pêche annuelle de 1974. Les tableaux des secteurs pour lesquels la prise est nulle ne sont pas représentés; seules les données d'effort sont regroupées en page 35.

La figure 1 représente le quadrillage statistique utilisé depuis 1971. Il a été constitué de la façon suivante : une zonation en 30 minutes de latitude a été retenue à partir de 10°N, puis quatre bandes ont été définies en fonction de la profondeur en partant de la côte :

bande 15 m	=	de 0	à	25 m
bande 50 m	=	de 25	à	75 m
bande 100 m	=	de 75	à	150 m
bande 500 m	=	au delà	de	150 m

Chaque zone d'un demi-degré est ainsi divisée en quatre secteurs, Un secteur correspond à un carré statistique. Le nom des zones est indiqué sur la figure.

Pour chaque secteur on trouvera les valeurs suivantes :

- nombre de visites : il correspond au nombre de passages, avec recherche du poisson dans le secteur ; un même bateau pouvant visiter plusieurs secteurs au cours d'une marée.
- Effort de pêche : c'est l'estimation du temps passé dans un secteur pour la recherche et la capture du poisson. Il est obtenu par soustraction du temps total d'un temps trajet moyen calculé pour gagner chaque zone (nul pour la zone de Dakar) et d'un temps de mouillage éventuellement. L'unité de temps est la dizaine d'heures,

- Effort de recherche : cette nouvelle unité d'effort est utilisée pour la première fois en 1974 afin de tenter de représenter uniquement le temps passé en recherche du poisson. Elle est obtenue par la formule suivante qui déduit les temps consacrés à la capture et à l'embarquement :

$$\text{effort de recherche} = \text{effort de pêche} - (\text{nombre de coup de filet} \times 0.06 + \text{Frise (qx)} \times 0.0007)$$

- Nombre de calées : il correspond au nombre total de coups de file-t (senne tournante) effectués dans la secteur.
- Temps de marée réel : il correspond au temps total passé en mer pour un secteur (temps de route inclus), exprimé en dizaine 3 'heures.
- Poids de la prise en quintaux : il eut donné pour 15 espèces principales, les autres étant regroupées sous la rubrique "divers". Les rejets de poissons à la mer ne sont pas inclus,
- Pourcentage en poids de la prise,,
- Prise par unité d'effort de pêche : c'est le rapport de la prise en quintaux à l'effort de pêche en dizaine d'heures.
- Prise par unité d'effort de recherche : c'est le rapport de prise en quintaux à l'effort de recherche en dizaine d'heures.
- Poids par visite : c'est le rapport de la prise en quintaux au nombre de visites,
- Poids par calée : c'est le rapport de la prise en quintaux au nombre de calées.
- Poids du rejet total.

Présentation des tableaux :

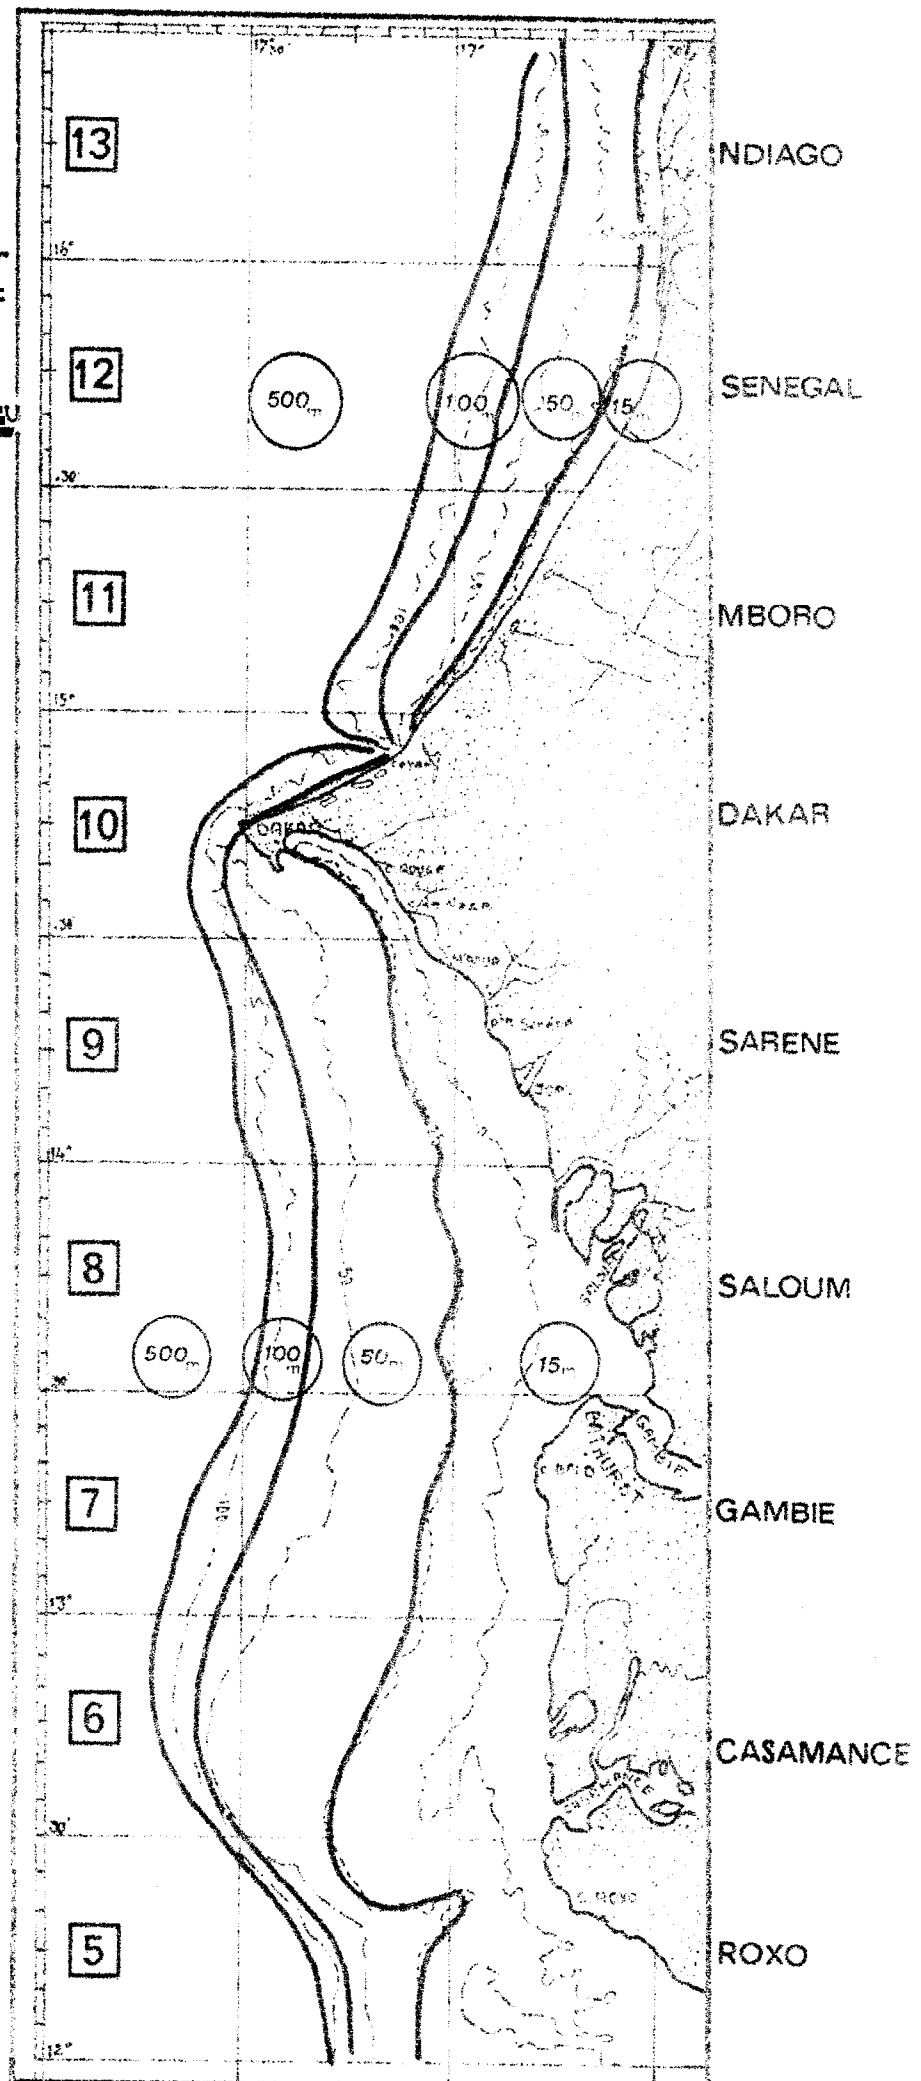

VISITES : nombre de visites
EFFORT : effort de pêche
EFFORT COR : effort de recherche
CALEES : nombre de calées
TPS MARÉE RÉEL DIZ HEUR : temps de marée réel.
PDS (qx) : poids de la prise en quintaux
P.100 : pourcentage en poids de la prise
F.U.E. : prise par unité d'effort de pêche
F.U.E. COR : prise par unité d'effort de recherche
PDS/VIS : poids par visite
PDS/CAL : poids par calées
PDS REJ TOT : poids du rejet total,
